

What is missing before Blushy can ship

Eleven open items, verified against the Android config, manifest, backend routes and Flutter sources. Only one is a code change; the rest is hosting and paperwork. Seven further requirements already pass and are summarised at the foot of page 2.

Assessed 11 Sep 2026 | Module BLUSHY_MAINAPP | Package com.blushy.blushy_love_app | Flutter 3.47.1 | Version 1.0.0+1

BLOCKING	NEEDS ATTENTION	CONSOLE-SIDE, UNSEEN	ALREADY SATISFIED

The only code blocker: there is no release keystore.
android/key.properties does not exist and no .jks file is present anywhere in the tree. Gradle therefore signs with the *debug* key, so the app-release.aab already sitting in the build directory will be rejected on upload. Everything else below is hosting or paperwork.

Blocking — review cannot pass without these

#	ITEM	STATUS	WHAT IS MISSING
05	Release signing key	BLOCKING	No keystore exists. Generate an upload key, write android/key.properties, and back the .jks up offline — losing it means the listing can never be updated again.
11	Store listing assets	BLOCKING	Nothing in the repo. Needed: a 512×512 icon, a 1024×500 feature graphic, at least two phone screenshots, an 80-character short description, a 4,000-character full description, and a category. The launcher mipmaps are not the same asset.
12	Privacy policy URL	BLOCKING	The page is written — web-legal/privacy.html — but was never uploaded to Hostinger. Play requires a reachable public URL; a 404 fails review immediately.
13	Data safety form	BLOCKING	Not filled. Must truthfully declare date of birth, cycle and symptom data, journal entries and recorded audio , and disclose that audio goes to Groq for transcription and text to OpenRouter for generation. A mismatch here is a common cause of enforcement action.
15	Content rating	BLOCKING	IARC questionnaire in Play Console. Not started; quick once the listing exists.
18	Health apps declaration	BLOCKING	Required for anything listed under Health & Fitness or Medical. Not started.

Needs attention — partly done, or unverified

#	ITEM	STATUS	WHAT IS MISSING
14	Account deletion — web half	ATTENTION	In-app deletion works: DELETE /me behind authentication plus a typed confirmation, clearing every collection. But web-legal/delete-account.html is not hosted, and Play requires a URL reachable <i>without</i> installing the app.
16	Target audience declaration	ATTENTION	The code already enforces 18+ — date of birth is a required onboarding step and the backend rejects anyone under eighteen. Only the Console declaration is outstanding, and it must say 18+ to match.
09	versionCode	ATTENTION	version: 1.0.0+1 gives versionCode 1, which is usable exactly once. Bump it before building the bundle that actually gets uploaded.
08	16 KB page alignment	ATTENTION	Required for Android 15+ submissions since Nov 2025. The Flutter engine supports it, but record, just_audio and file_picker each ship their own native libraries. Verify on the built bundle rather than assuming.

#	ITEM	STATUS	WHAT IS MISSING
21	AI copy wording	ATTENTION	The disclaimer covers the app as a whole, but the generated Docsy and Discover text has not been read end-to-end for imperative medical phrasing. One review pass before submission.

Console-side — could not be checked from the code

Developer account and identity verification. Personal accounts verify with government ID and address; organisation accounts need a D-U-N-S number, which can itself take days.

Public contact email and physical address. Both appear on the public listing — worth deciding now whether that is a personal address.

Closed test: 12 testers for 14 days. Applies to *personal* accounts opened after November 2023; organisation accounts are exempt. Twelve testers must stay opted in continuously for a fortnight before the production track unlocks. If this applies it is the longest lead time on the list and nothing shortens it — start it first.

Order to work in

Sequenced by dependency, not by effort. The first two gate everything downstream.

01	Confirm the account type	Personal or organisation decides whether the fourteen-day closed test applies. If it does, recruit the twelve testers today — the clock runs in parallel with everything below.
02	Generate the upload keystore	Turns the existing debug-signed bundle into a publishable one. Back the file up offline.
03	Upload the three legal pages to Hostinger	Unblocks two mandatory Console fields at once: the privacy policy URL and the deletion URL. The files are already written.
04	Decide the production API host	blushy-api.onrender.com or blushy-api-151h. The base URL is compiled into the binary, so this must be settled before the upload build.
05	Produce the listing graphics and copy	Icon, feature graphic, screenshots, both descriptions.
06	Complete the four Console forms	Data safety, content rating, target audience at 18+, health apps declaration.
07	Bump the version, rebuild, verify alignment	Move off 1.0.0+1, rebuild signed, confirm 16 KB alignment on the artifact that will be uploaded.
08	Review AI copy for clinical phrasing	The item most likely to be raised in review if skipped.

Not blocking review, but will bite

Push notifications are a stub. POST_NOTIFICATIONS is declared in the manifest, but pubspec.yaml contains no Firebase dependency and the token source returns null by design. Notifications will never arrive, and shipping an unused permission is a small inconsistency with the data safety form.

The production API is a sleeping free service. The app points at <https://blushy-api.onrender.com>, which cold-starts after idle — a reviewer opening the app after a quiet period sees a hang, not a login screen. That host is also not the one carrying REDIS_URL; that is blushy-api-151h, on a different account.

Already satisfied — no action needed

- The app bundle builds.
- targetSdk resolves to 36, mandatory since 31 Aug 2026.
- 64-bit libraries, minSdk 24.
- Cleartext HTTP is confined to debug builds.
- The manifest holds only four permissions, none of which require a declaration; no ad SDK, no advertising ID, no in-app purchases.
- Health data cannot reach advertising, because no advertising SDK exists in the project.
- The medical disclaimer is surfaced *and recorded server-side*, with versioned documents that re-prompt on change — above the bar Play sets.

Statuses reflect the working tree on 11 September 2026. Backend changes made in the current session are uncommitted and therefore absent from the deployed service, which last built from commit 400658f.
